The **Green activator** is a system easy to install. You can simply attach it to your existing main water pipe from outside.

The **Green activator** works without electricity and chemistry. It reduces the surface tension of water by permanent magnetism and rises the viscosity of water.

Because of the changed water structure, deposits at pipes and nozzles diminish. The duration of life of irrigation installations gets longer.

The advantages of the Green activator:

- diminishment of lime and ferric deposits
- finer atomised spray
- better absorption of water and fertiliser of the green
- fast, even and cut compatible putting green
- sturdy, tough and regenerating
- shadow lawn
- despite extensive utilisation the lawn stays resistant and robust
- reduction of biotic harms like fungal problems
